## EXECUTIVE SUMMARY

This report compares the brand-portfolio strength of four major FMCG groups in Indonesia - Wings Group, Indofood, Mayora, and Unilever Indonesia - without reducing the question to a single measure. Portfolio strength can appear as brand-family breadth, leadership in selected categories, positional stability, momentum, competitive persistence, or evidence that specific business actions align with company results. Because each dimension has a different unit, scope, and evidence quality, the report keeps them separate before synthesizing conclusions across the evidence base.

The main results show distributed leadership. Indofood leads brand-family breadth with 38 families under the strict-control definition, narrowly ahead of Wings Group with 37, while Unilever Indonesia has 25 and Mayora 22. Across five complete focal categories in 2026, Unilever Indonesia leads three categories and Wings Group two. Across five longitudinal blocks that can be compared directly, Wings Group leads observed stability in four blocks, while momentum is shared by Indofood and Unilever Indonesia with two blocks each; Wings Group leads one block.

Competitive persistence tells a different story. Unilever Indonesia retains all three observed incumbent opportunities, Indofood loses its one observed incumbent opportunity, and Wings Group records one challenger takeover in cup instant noodles. Opportunity counts differ across groups, so these results are not converted into a portfolio-level persistence ranking. Likewise, public Brand Footprint evidence does not provide a sufficiently comparable consumer-reach universe for ranking all four groups, while performance-weighted portfolio concentration is not calculated because the category evidence does not share an additive scale.

*The strategy and company-results track extends the analysis without turning temporal alignment into causality. The evidence set contains 22 documented business actions: eight for Wings Group, four for Mayora, and ten for Unilever Indonesia. For Indofood, the extraction retains management explanations and company results but does not identify discrete actions that meet the same action-result pairing standard. Of the 22 actions, only one pair is directly supported at a descriptive level: Sunlight distribution coverage in Q1 2025, reported at more than 70% of directly served stores. Four other actions are only temporally aligned, two are company-reported attributions, one is context only, and 14 are not assessable because compatible results are unavailable at the required level.*

The final conclusion is not that there is 'no winner,' but that the definition of winning determines who leads. Indofood leads breadth; Unilever Indonesia leads the selected-category snapshot and shows strong incumbent retention in the opportunities observed; Wings Group leads observed stability and records one challenger takeover; and Indofood and Unilever Indonesia share momentum leadership. Strategy-result evidence is not comparable enough to rank strategy effectiveness. A single overall winner is therefore not defensible without post hoc weighting and a combined scale that the evidence does not support.

# CHAPTER I. INTRODUCTION

## 1.1 Background

Indonesia's FMCG market is populated by companies and business groups with very different portfolio structures. Some build scale through many brand families, some sustain strength in particular categories, while others show more stable historical positions or stronger momentum over specific periods. These differences mean that the question 'who is strongest?' cannot be answered simply by counting brands, citing one popularity survey, or reading a single company sales figure.

Wings Group, Indofood, Mayora, and Unilever Indonesia are selected as the four primary objects because each has a broad consumer-facing portfolio across multiple household-consumption arenas. Their legal and reporting structures, however, are not symmetric. Wings Group is privately held and has limited public financial results at brand granularity; Indofood operates an integrated structure that extends beyond packaged FMCG; Mayora reports consolidated results covering domestic and export activity; and Unilever Indonesia experienced ownership-perimeter changes after the Ice Cream business separation on 8 December 2025 and the SariWangi transfer on 2 March 2026. These differences must be controlled before performance or strategy can be compared.

The report separates two evidence tracks. Track A assesses portfolio strength through breadth, selected category position, longitudinal consistency, momentum, and competitive persistence. Track B assesses whether documented business strategies - such as product innovation, pricing, distribution, marketing, sourcing, or capital allocation - can be paired with compatible results in the same period and scope. This separation prevents aggregate company results from being used to 'prove' the effectiveness of a specific brand action merely because the timing is close.

Survey sources also measure different constructs. Top Brand Index (TBI) is a weighted survey index based on source parameters, not market share. Consumer Reach Points (CRP), penetration, purchase frequency, rank, and reach statements from Brand Footprint are likewise not revenue or sales market share. The report therefore preserves source-native terminology and avoids combining metrics that do not share a common scale (Frontier / Top Brand Award, n.d.; Worldpanel by Numerator, 2024).

Within this framework, the title 'Portfolio Power' is treated as an analytical question. The report does not assume in advance that one group must be the overall winner. Instead, each dimension is evaluated according to pre-defined rules, then synthesized to determine whether a single winner remains defensible or whether strength is distributed across dimensions.

## **1.2 Problem Statement and Analytical Questions**

The core problem is how to compare the portfolio strength of four FMCG groups without mixing distinct constructs, granting ownership credit beyond verified control, or turning association and company explanations into causal claims. The problem is expressed through seven analytical questions:

1. Which group has the broadest brand portfolio based on strict-control brand-family breadth?
2. Is portfolio strength concentrated in a few brands, or does it appear through leadership across multiple selected categories?
3. Which group most often produces category leaders or strong positions in comparable snapshots?
4. Which group shows the highest consistency over time in eligible longitudinal blocks?
5. Which group is most persistent when acting as an incumbent, and where does a challenger successfully take over?
6. How can documented business strategies be read alongside company results without exceeding attribution, geography, and reporting-perimeter boundaries?
7. Can all dimensions be combined defensibly into a single overall winner?

## **1.3 Analytical Objectives**

The analysis aims to build a transparent, measurable portfolio comparison that preserves the meaning of each source. Specifically, the report aims to:

1. map brands and brand families to groups based on control during the observation period, including ownership changes and joint-venture relationships;
2. measure verifiable portfolio breadth without double-counting sub-brands, variants, or pack formats;
3. compare group leadership across complete focal categories while preserving TBI as a survey index rather than market share;
4. assess stability and momentum only within longitudinal blocks that pass comparability rules;
5. separate incumbent retention from challenger takeover in persistence analysis;
6. link documented business actions to compatible results through explicit evidence statuses; and
7. synthesize dimensions without normalization, weighting, or a composite score that is not defensible.

## **1.4 Scope and Limitations**

### **1.4.1 Analytical Scope**

- The primary objects are Wings Group, Indofood, Mayora, and Unilever Indonesia. Attribution follows ownership mapping for the observation period rather than general brand association.
- Track A uses evidence on breadth, TBI in selected categories, longitudinal consistency, momentum, competitive persistence, and Brand Footprint only in the contextual role permitted by comparability rules.
- Track B covers product strategy, pricing, marketing, distribution, supply/procurement, productivity/integrated model, capital allocation, and reporting-perimeter changes when documented by official sources and supported by results that can be evaluated.
- Reference periods differ by source. Historical observations are used only while the brand remains within a valid ownership perimeter.
- Final analysis reports leaders by dimension; no single cross-dimensional score is constructed.

### **1.4.2 Analytical Limitations**

- Public survey coverage is selective. A brand absent from a public summary is not treated as zero or as evidence that the brand is uncompetitive.
- Historical Top Brand methodology cannot be independently verified in full. The 2022-2025 blocks used for longitudinal analysis remain comparable with caveats and are not numerically bridged to the 2026 methodology cluster.
- Brand Footprint contains a geographic break: urban editions through 2020 are not ordinarily joined to national urban-rural coverage beginning with the 2021 edition.
- Result disclosure is asymmetric across groups. Limited Wings disclosure is not interpreted as weak performance; richer disclosure by Unilever or other public companies is not treated as a performance advantage.
- Consolidated sales, operating profit, and margin are not automatically attributable to a particular brand, category, or Indonesian household demand.
- Temporal alignment is not causation. Management explanations remain company-reported unless compatible independent evidence is available.

## **1.5 Project Outputs**

Project outputs comprise the analytical report, structured data and metadata, executed notebooks, validation outputs, and analytical visualizations. The repository provides a traceable path from sources and ownership mapping to standardized data, analytical results, the evidence map, and

findings. This report summarizes that path for readers without exposing code or operational publishing details that are not relevant to the analysis itself.

## CHAPTER II. PORTFOLIO COMPARISON AND EVIDENCE FRAMEWORK

This chapter defines portfolio strength, determines which group receives credit for a brand, explains how each source is interpreted, and establishes when observations may be compared. The framework is necessary because the four groups differ in ownership structure, category coverage, disclosure, and measurement sources.

### 2.1 Comparison Objects and Definition of Portfolio Power

*Portfolio power is defined as a set of dimensions describing breadth, competitive position, continuity of position, and the ability of a portfolio to generate or preserve strength in measurable contexts. The definition is intentionally plural. Brand count is not the same as category dominance; category leadership is not the same as stability; stability is not the same as momentum; and company financial results are not the same as the effect of one brand strategy.*

**Table 2.1** *Dimensions of Portfolio Power and Interpretation Boundaries*

| Dimension                    | Question answered                                                         | Interpretation boundary                                         |
|------------------------------|---------------------------------------------------------------------------|-----------------------------------------------------------------|
| Breadth                      | How broad is the brand-family portfolio within the control perimeter?     | Not structural category breadth or a measure of sales strength. |
| Selected category leadership | Who leads among focal groups in a complete category snapshot?             | Not market share or full-market leadership.                     |
| Observed stability           | Who has lower absolute period-to-period change within a comparable block? | Stability is not strength.                                      |
| Momentum                     | Who has the higher net TBI change within a category block?                | Magnitude is not averaged across categories.                    |
| Competitive persistence      | Does the incumbent retain its position, or does a challenger take over?   | Opportunity counts differ across groups.                        |
| Strategy-result evidence     | How strongly can a documented action be paired with a compatible result?  | Evidence availability is not performance.                       |

**Note:** All dimensions are kept separate and are not normalized into a composite score.

## 2.2 Ownership Perimeter and Reporting Entities

Brand attribution follows strict-control ownership in the reference period. This prevents brands that are merely associated with a group, managed through a joint venture, or already divested from being counted as fully owned. The ownership registry preserves operating company, brand family, brand label, relationship type, ownership start/end dates, source, and verification status.

**Table 2.2** *Ownership Perimeters of the Four FMCG Groups*

| Group              | Primary perimeter                                                                           | Special treatment                                                                                                                  |
|--------------------|---------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Wings Group        | Verified group-level controlled portfolio.                                                  | PT Lion Wings, PT Glico Wings, PT Calbee Wings, and explicit JVs = joint ventures; no full strict-control credit.                  |
| Indofood           | Consumer Branded Products; Bogasari consumer flour; Agribusiness consumer edible oils/fats. | Distribution, upstream, and industrial-only activities remain context; consolidated parent results are broader than packaged FMCG. |
| Mayora             | PT Mayora Indah Tbk and consolidated subsidiaries.                                          | PT Tirta Fresindo Jaya = related-group affiliate; Le Minerale is sensitivity-only.                                                 |
| Unilever Indonesia | PT Unilever Indonesia Tbk according to ownership period.                                    | Ice Cream ended 8 Dec 2025; SariWangi ended 2 Mar 2026; later outcomes exclude disposed businesses.                                |

Wings receives group-level credit when the operating entity cannot be resolved from public sources, while explicit joint ventures remain excluded from strict-control primary credit. Indofood consumer-facing scope extends beyond ICBP only when Bogasari or Agribusiness businesses have verifiable consumer brands. For Mayora, the relationship between Le Minerale and the broader group is insufficient to establish consolidation of PT Tirta Fresindo Jaya, so the brand is excluded from primary results. For Unilever, time-varying ownership rules prevent divested brands from being carried into periods after disposal.

## 2.3 Brand Family, Brand, and Category

*The breadth unit is the canonical brand family, not every product variant. Mie Sedaap, for example, may appear through different formats or derivative labels, but primary breadth does not count each format as a new brand family. Category-level analysis instead follows source subcategories that can be mapped consistently. Because category mapping for Wings remains*

*incomplete in the structural universe, the project does not calculate structural category breadth and limits the conclusion to brand-family breadth.*

## 2.4 Two Evidence Tracks

**Table 2.3** *Roles of Track A and Track B*

| Track                                  | Focus                                                                                                          | Example output                                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Track A - Portfolio performance        | Breadth, selected leadership, longitudinal stability, momentum, persistence, sensitivity.                      | 38 vs 37 vs 25 vs 22 brand families; 3/5 vs 2/5 selected categories; block-level leaders.           |
| Track B - Strategy and company results | Documented action -> intended mechanism -> observable result -> temporal/scope alignment -> evidence strength. | Direct descriptive, temporal alignment, company-reported attribution, context-only, not assessable. |

*Track A and Track B do not substitute for one another. Track A can show portfolio strength even when the strategy that produced that strength is unknown. Track B can document a business action without proving that the action improved a category, sales, or profitability. Final synthesis connects the two tracks only at an interpretation level supported by the evidence.*

## 2.5 Metric Semantics and Prohibition on Semantic Upgrading

**Table 2.4** *Semantic Rules for Core Metrics*

| Metric/source                          | Meaning preserved                                            | Must not be called                                                                |
|----------------------------------------|--------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Top Brand Index (TBI)                  | Weighted survey index within the source category and period. | Market share, revenue share, or a cross-category interval scale.                  |
| Brand rank                             | Ordinal position within the universe reported by the source. | Interval performance difference or continuous score.                              |
| CRP / penetration / purchase frequency | Source-native Brand Footprint measures.                      | Revenue, market share, or sales volume.                                           |
| Direct-store coverage                  | Availability/distribution among directly served stores.      | Consumer reach, purchase, sales impact, or profitability.                         |
| Sales / operating profit               | Results within a defined reporting perimeter.                | Volume, brand result, or the effect of one strategy without attribution evidence. |

## 2.6 Comparability Framework

Comparability is determined before synthesis. Top Brand observations are compared longitudinally only within the same brand and source subcategory and within methodology clusters without unresolved breaks. TBI values are not averaged or ranked across subcategories. Missing cells remain unavailable and are not converted to zero. Brand Footprint urban editions are separated from national urban-rural editions because geography and household frames changed. Cross-source pooling of TBI, CRP, penetration, rank, reach bounds, and text statuses is prohibited.

**Table 2.5** *Comparability Classes*

| Status                         | Meaning                                                                           | Consequence                                                                    |
|--------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| directly_comparable            | Definition, coverage, unit, and methodology cluster match.                        | Direct comparison is permitted.                                                |
| comparable_with_transformation | Same construct after a documented reversible transformation.                      | Original values are preserved; rank is not converted into an interval measure. |
| comparable_with_caveat         | Comparison is possible with a material caveat.                                    | The caveat must remain attached to interpretation.                             |
| context_only                   | Relevant information that cannot enter ranking or aggregation.                    | Used only as narrative context.                                                |
| not_comparable                 | Differences in construct, coverage, ownership, or methodology prevent comparison. | Not combined or substituted.                                                   |

## 2.7 Evidence Hierarchy for Strategy-Result Linkages

**Table 2.6** *Strategy-Result Evidence Statuses*

| Evidence status       | Meaning in this report                                                                                                                   |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| directly_supported    | Action and result share compatible object, geography, period, and construct; remains descriptive unless the design identifies causality. |
| supported_with_caveat | Support is available but subject to material scope, methodology, or attribution limits.                                                  |

| Evidence status          | Meaning in this report                                                                                                |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------|
| temporally_aligned       | Action and result occur in aligned periods, but the result is too aggregated or alternative factors are not isolated. |
| company_reported         | The company attributes the outcome to a mechanism or action; this is not upgraded to an independent conclusion.       |
| plausible_but_unverified | The mechanism is plausible but observations are insufficient.                                                         |
| context_only             | Information explains perimeter, structure, or context; it is not effect evidence.                                     |
| not_assessable           | No compatible result is available or the linkage gate is not met.                                                     |

## 2.8 Final Evaluation Framework

A single overall winner can be declared only when the combined dimensions have a defensible scale, controlled missingness, comparable units, and weights specified before results are observed. Those conditions are not met. Final evaluation therefore uses dimension-level leaders and treats “not defensible” as a substantive methodological conclusion rather than an analytical failure.

## CHAPTER III. DATA AND METHODOLOGY

This chapter explains how sources, ownership mapping, standardization, eligibility, and synthesis produce the evidence used in Chapters IV-VI. The discussion is organized by methodological function rather than technical development sequence.

### 3.1 Data Sources and Selection

Sources are selected based on authority, relevance, accessibility, legal usability, coverage, and the ability to preserve provenance. Corporate websites and filings are used primarily for ownership, portfolio scope, documented actions, and financial/result observations. Frontier / Top Brand Award provides available public category and TBI observations. Worldpanel by Numerator is used selectively for methodology and public Brand Footprint facts. Sources that are confidential, restricted, or have unclear terms are not extracted in bulk.

**Table 3.1** *Functions of Source Groups*

| Source group                          | Primary function                                                                   | Control                                                                                       |
|---------------------------------------|------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| Official corporate websites           | Portfolio listings, launches, channel/price actions, corporate scope.              | Company claims are labelled and are not equated with independent performance evidence.        |
| Annual reports / financial statements | Consolidation, reporting perimeter, sales/profit results, management explanations. | Parent/company scope is not automatically brand/category/Indonesian household scope.          |
| Top Brand public pages                | TBI, category, brand, ordinal category position.                                   | TBI is not market share; historical continuity is audited.                                    |
| Brand Footprint public summaries      | Methodology and selected reach/rank/growth context.                                | Public universe is incomplete; rank is not interval scale; urban/national break is preserved. |

### 3.2 Acquisition, Usage Rights, and Provenance

*The project registry records publisher, title, URL, publication date, reference period, retrieval date, geography, metric, methodology version, access status, redistribution status, copyright status, scraping status, and raw-storage status. When a source permits only factual reference or public-summary use, the repository preserves provenance and derived facts rather than reproducing proprietary reports. The ability to access a page is not treated as permission to redistribute the full source.*

### **3.3 Ownership Mapping and Brand Normalization**

*Ownership mapping is completed before breadth is counted or performance observations are attributed. Each row preserves group, operating company, brand family, brand label, category scope, relationship type, ownership period, source, verification status, and notes. Relationship classes include controlled, controlled\_group\_portfolio, joint\_venture, related\_group\_affiliate, former\_portfolio, controlled\_context\_only, and unclear. Only relationships meeting strict-control primary rules enter primary breadth.*

*Normalization distinguishes brand families from variants, sub-brands, and formats. This reduces double counting when one brand family appears through multiple product labels. A separate sensitivity rule is applied to Le Minerale because PT Tirta Fresindo Jaya is recorded as a related party/affiliate to Mayora rather than a consolidated subsidiary of PT Mayora Indah Tbk in the reporting basis used.*

### **3.4 Observation Standardization and Missingness**

Observations preserve identity, source family, reference period, category/subcategory, brand, metric, unit, geography, methodology cluster, ownership validity, attribution scope, and observation status. Missing or unavailable values are not filled with zero. Values are not interpolated, extrapolated, winsorized, or deleted merely to make a series appear cleaner. Methodology and geography changes create explicit comparability boundaries.

### **3.5 Measuring Portfolio Breadth**

*Primary breadth is defined as the number of current strict-control canonical brand families. The count is performed after excluding non-primary records such as joint ventures, related affiliates, former portfolio entries, and context-only records. Because comparable structural category mapping is incomplete for Wings Group, category breadth is not calculated. The valid result is brand-family breadth, not the number of categories controlled or the degree of market dominance.*

### **3.6 Measuring Selected Category Leadership**

*Category leadership uses focal categories with a complete denominator among the relevant focal groups in the same reference period. For the 2026 snapshot, five categories qualify: White Coffee; Ready-to-Drink Fruit Drinks; Antiseptic Bath Soap; Cup Instant Noodles; and Sweet Soy Sauce. The leader is the focal group with the highest observed TBI in that category. The result is described as focal-group leadership, not full-market leadership, because the analytical universe is limited to the four groups and public source coverage.*

### 3.7 Longitudinal Stability and Momentum

*Longitudinal analysis is limited to five historical Top Brand blocks from 2022-2025 with consistent identity and category definitions: Antiseptic Bath Soap, Bagged Instant Noodles, Cup Instant Noodles, Ready-to-Drink Fruit Drinks, and Sweet Soy Sauce. Historical methodology is not upgraded to fully verified status; results remain comparable with caveats and are not bridged to 2026.*

*Observed stability uses the mean absolute period-to-period TBI change within each block; a lower value indicates a more stable series within that block, not a stronger brand. Momentum uses net TBI change from the start to the end of the block; a higher value indicates stronger momentum within that category. Net change is not averaged across categories because TBI magnitude is meaningful only within each category.*

### 3.8 Competitive Persistence

*Persistence separates two roles. Incumbent retention is assessed only when a group starts the baseline as focal-group leader and a follow-up observation is available. Challenger takeover is recorded when a non-incumbent group becomes the leader at follow-up. Opportunity counts remain explicit; a group with no observed baseline-incumbent opportunity is not assigned a retention rate of zero. This prevents absence of opportunity from being interpreted as failure.*

### 3.9 Strategy-Result Linkage

Each business action passes through the chain: documented strategy -> intended mechanism -> observable result -> temporal/scope alignment -> evidence strength. Gates test reporting entity, brand/business scope, geography, reference period, metric construct, ownership validity, and alternative explanations. An action without a compatible result is retained as a documented action with a not-assessable status.

The evidence set contains 22 documented actions: eight for Wings, four for Mayora, and ten for Unilever Indonesia. Indofood has no discrete action that meets the same extraction standard in this evidence set; instead, the project preserves three management-attribution claims and company results as company-reported evidence. This asymmetry must not be converted into a ranking of strategy quality.

### 3.10 Cross-Track Synthesis and Overall-Winner Gate

*Cross-track synthesis combines conclusions rather than incompatible numbers. Track A leaders remain attached to their own definitions. Track B may add context about documented strategy and evidence strength, but it may not convert action counts into performance scores or provide a*

causal explanation for Track A without a compatible result pair. The overall-winner gate requires a common scale and pre-specified weighting. Because those conditions are unavailable, final synthesis uses dimension-specific conclusions.

### 3.11 Validation and Reproducibility

Validation checks provenance, ownership period, strict-control attribution, category mapping, metric semantics, methodology breaks, duplicates, missingness, evidence status, result scope, output completeness, and cross-track consistency. Final analytical consolidation contains seven dimension-summary rows, ten findings, ten evidence-map rows, six figure specifications, and forty validation checks with zero critical failures. The final gate is *PASS\_WITH\_CAVEAT* because source and comparability limitations remain material, not because validation failed.

**Table 3.2** Core Reproducibility Artifacts

| Artifact                | Function                                                                   | Link                          |
|-------------------------|----------------------------------------------------------------------------|-------------------------------|
| Project repository      | Index of all data, metadata, notebooks, and outputs.                       | <a href="#">Open artifact</a> |
| Ownership registry      | Brand-group perimeter and ownership period.                                | <a href="#">Open artifact</a> |
| Comparability rules     | Rules for comparing Top Brand, Brand Footprint, and cross-source evidence. | <a href="#">Open artifact</a> |
| Final dimension summary | Dimension-level conclusions used as the report basis.                      | <a href="#">Open artifact</a> |
| Final findings          | Ten validated findings.                                                    | <a href="#">Open artifact</a> |
| Final evidence map      | Traceability from findings to Track A / Track B / figures.                 | <a href="#">Open artifact</a> |

[Project repository - open on GitHub](#)

### 3.12 Data and Methodological Limitations

- Public Top Brand and Brand Footprint coverage does not represent the full brand universe symmetrically.
- Historical Top Brand continuity cannot be fully verified; 2022-2025 analysis remains caveated.
- Brand Footprint contains an urban-to-national coverage break, and public summaries include only selected facts.

- Wings has more limited public result disclosure than listed companies; a disclosure gap is not a performance gap.
- Indofood parent and ICBP results have a broader and mixed-geography perimeter than Indonesian household FMCG demand.
- Mayora consolidated results combine domestic and export activity; input costs remain a material alternative factor.
- Unilever experienced reporting-perimeter changes related to the Ice Cream separation and SariWangi transfer.
- No causal identification is performed. The direct descriptive Sunlight pair does not prove sales, market share, consumer reach, or profitability impact.

## CHAPTER IV. PORTFOLIO PERFORMANCE RESULTS

This chapter presents Track A: structural breadth, selected category leadership, stability, momentum, persistence, and sensitivity. Each result is interpreted within its own denominator and scope; no figure combines these metrics into one axis or score.

### 4.1 Performance Dimension Summary

**Table 4.1** *Summary of Track A Results*

| Dimension                    | Leader/status       | Main result                                            | Critical caveat                                                     |
|------------------------------|---------------------|--------------------------------------------------------|---------------------------------------------------------------------|
| Brand-family breadth         | Indofood            | 38; Wings 37; Unilever 25; Mayora 22.                  | Not structural category breadth.                                    |
| Selected category leadership | Unilever Indonesia  | 3/5 categories in 2026; Wings 2/5.                     | Focal-group leadership, not market share or full-market leadership. |
| Observed stability           | Wings Group         | 4/5 directly comparable blocks.                        | Stability is not strength.                                          |
| Momentum                     | Indofood + Unilever | 2/5 blocks each; Wings 1/5.                            | Magnitude is not averaged across categories.                        |
| Competitive persistence      | Role-specific       | Unilever 3/3 retained; Indofood 0/1; Wings 1 takeover. | Opportunities are unequal.                                          |
| Consumer reach               | Not comparable      | Public Brand Footprint facts are context-only.         | No common CRP universe.                                             |
| Portfolio concentration      | Not eligible        | Performance-weighted HHI is not calculated.            | Cross-category evidence is not additive.                            |

### 4.2 Indofood Leads Verified Strict-Control Brand-Family Breadth

After ownership filtering and brand-family normalization, Indofood has 38 current strict-control canonical brand families. Wings Group follows very closely with 37, Unilever Indonesia has 25, and Mayora 22. Indofood is therefore the unique leader under the breadth definition used. The Indofood-Wings difference is only one brand family, so the appropriate interpretation is a narrow lead within the verified universe rather than broad structural dominance.

Wings has 45 current strict-control records but 37 canonical brand families because several records are labels or formats within the same family. All 45 Wings records also retain unresolved category mapping in the structural universe. The project therefore does not calculate category breadth. Filling incomplete mapping with assumed categories would create false precision and could alter the ranking artificially.

**Figure 4.1 Verified Strict-Control Brand-Family Breadth**

*Source: project calculations from the ownership registry and structural-breadth results. Brand-family breadth is not structural category breadth or strategy effectiveness.*

Figure 4.1 shows why breadth alone cannot answer who is strongest in categories. Indofood has the largest number of brand families within the primary perimeter, but the next result shows that the selected-category leadership snapshot is instead led by Unilever Indonesia. Breadth and category position must therefore remain separate dimensions.

#### **4.3 Unilever Leads Five Selected Complete Focal Categories in 2026**

Five 2026 categories provide complete denominators among the relevant focal groups. Wings Group leads White Coffee through TOP White Coffee and Cup Instant Noodles through Mie Sedaap Cup. Unilever Indonesia leads Ready-to-Drink Fruit Drinks through Buavita, Antiseptic Bath Soap through Lifebuoy, and Sweet Soy Sauce through Bango. Indofood and Mayora are not focal-group leaders in these five snapshots.

**Table 4.2** *Selected Complete Focal-Category Leadership - 2026*

| 2026 category               | Focal-group leader             | Leader TBI | Nearest recorded focal competitor |
|-----------------------------|--------------------------------|------------|-----------------------------------|
| White Coffee                | Wings Group - TOP White Coffee | 10.0       | Mayora - KOPIKO L.A. White 6.0    |
| Ready-to-Drink Fruit Drinks | Unilever - Buavita             | 41.1       | Wings - Floridina 16.0            |
| Antiseptic Bath Soap        | Unilever - Lifebuoy            | 43.5       | Wings - NUVO 9.1                  |
| Cup Instant Noodles         | Wings - Mie Sedaap Cup         | 60.3       | Indofood - Pop Mie 17.8           |
| Sweet Soy Sauce             | Unilever - Bango               | 52.7       | Indofood 4.8; Wings Sedaap 3.7    |

**Note:** TBI is a source-native survey index. Values in the table are not market share; leader means only the highest observed focal group within that category.

**Figure 4.2 Leadership Across Five Complete Selected Focal Categories - 2026**

*Source: project calculations from Top Brand public observations. Counts represent selected focal-category leadership events, not market share or full-market leadership.*

Unilever leads three of the five events and Wings two. The 60% and 40% proportions are shares of the five selected events only; they must not be presented as market-leadership rates for the entire FMCG market. The strength of this result is its explicit denominator and complete category coverage within the defined scope.

#### 4.4 Stability and Momentum Produce Different Leaders

The five 2022-2025 blocks that are directly comparable with caveats produce a contrasting pattern. Wings Group leads observed stability in Antiseptic Bath Soap, Cup Instant Noodles, Ready-to-Drink Fruit Drinks, and Sweet Soy Sauce. Indofood leads stability in Bagged Instant Noodles. Wings therefore leads four of the five blocks.

Momentum does not follow the same pattern. Unilever Indonesia leads momentum in Antiseptic Bath Soap and Ready-to-Drink Fruit Drinks. Indofood leads in Bagged Instant Noodles and Sweet Soy Sauce. Wings leads in Cup Instant Noodles. This creates a momentum co-lead for Indofood and Unilever at two blocks each, with Wings leading one block.

**Table 4.3** *Leaders by Comparable Longitudinal Block*

| 2022-2025 block             | Observed stability leader    | Momentum leader               |
|-----------------------------|------------------------------|-------------------------------|
| Antiseptic Bath Soap        | Wings Group - NUVO           | Unilever Indonesia - Lifebuoy |
| Bagged Instant Noodles      | Indofood - Sarimi            | Indofood - Sarimi             |
| Cup Instant Noodles         | Wings Group - Mie Sedaap Cup | Wings Group - Mie Sedaap Cup  |
| Ready-to-Drink Fruit Drinks | Wings Group - Floridina      | Unilever Indonesia - Buavita  |
| Sweet Soy Sauce             | Wings Group - Sedaap         | Indofood - Indofood           |

**Note:** Stability uses mean absolute change; momentum uses net change within each block. Historical Top Brand methodology remains caveated.

**Figure 4.3 Observed Stability and Momentum Leaders Across Comparable Blocks**

*Source: project calculations. Stability is not strength; momentum magnitude is not averaged across categories.*

This separation matters. Wings can be the most stable in more blocks while Indofood and Unilever together lead more momentum blocks. Treating stability as strength would be misleading because a series can be stable at either a low or high level. Likewise, momentum reflects the direction of change within a category-period block, not general portfolio-wide growth capacity.

#### **4.5 Competitive Persistence: Incumbent Retention and Challenger Takeover**

*Persistence analysis produces four eligible incumbent opportunities. Unilever Indonesia has three baseline-incumbent opportunities and retains all three. Indofood has one opportunity and does not retain it. Wings has no baseline-incumbent opportunity in this opportunity set, but records one challenger takeover in Cup Instant Noodles, where Mie Sedaap Cup takes focal-group leadership from Pop Mie in 2024 and retains it in 2025 and in the separately methodological 2026 snapshot.*

## Competitive Persistence Paths in Eligible Historical Categories

*Roles and opportunity counts differ; this figure is not a portfolio-level persistence ranking.*

**Figure 4.4 Competitive Persistence Paths in Eligible Historical Categories**

*Source: project calculations. Incumbent retention and challenger takeover are different roles; opportunity counts are unequal.*

Unilever's 3/3 result indicates strong retention within the opportunities observed, but it cannot be mechanically compared with Indofood's 0/1 as a portfolio-level rate because the denominators are very different. Wings also must not be assigned an incumbent-retention rate of zero because the opportunity was not observed; replacing “no opportunity” with zero would turn missingness into a false performance signal.

### 4.6 Consumer Reach and Portfolio Concentration Are Not Yet Rankable

*Brand Footprint provides important context on household choice, CRP, penetration, and rank, but public summaries do not provide a complete common source-native universe for all focal groups in the same period. Coverage also changes from urban-only editions to national urban-rural coverage beginning with the 2021 edition. Consumer reach therefore remains not comparable for cross-group ranking in this project.*

*Portfolio concentration is also not calculated through a performance-weighted HHI. TBI values belong to different categories and are not additive; Brand Footprint facts are selective; and ordinal rank cannot be converted into share. An HHI derived from these metrics would create a distribution without a valid economic denominator. This methodological ineligibility is retained as a finding rather than “solved” through arbitrary normalization.*

#### 4.7 Mayora and Le Minerale Sensitivity

Le Minerale is operated by PT Tirta Fresindo Jaya and is related to the Mayora group, but the audited corporate structure used here does not place PT Tirta Fresindo Jaya as a consolidated subsidiary of PT Mayora Indah Tbk. Le Minerale is therefore excluded from primary strict-control breadth and included only in a pre-specified sensitivity analysis.

When Le Minerale is added to the sensitivity scope, Mayora breadth increases from 22 to 23 brand families. Mayora remains fourth, so the primary conclusion does not change. This sensitivity shows that the treatment of one material affiliate does not alter the breadth leader or the overall-winner conclusion.

#### 4.8 Track A Summary

##### **TRACK A - KEY FINDINGS**

Indofood leads breadth; Unilever Indonesia leads selected 2026 category leadership; Wings Group leads observed stability; Indofood and Unilever share momentum leadership; persistence is role-specific; and the Mayora sensitivity does not change the breadth ranking. No single group leads every dimension.

## CHAPTER V. STRATEGY AND COMPANY-RESULT EVIDENCE

This chapter presents Track B. Its purpose is not to construct a persuasive strategy narrative, but to test how far documented actions can be paired with observable results at compatible scope. Results that cannot be assessed remain evidence limitations; they are not converted into performance judgments.

### 5.1 From Documented Strategy to Evidence Strength

*The action universe includes product innovation, explicit price points, pricing policy, marketing/promotion, distribution/channel execution, domestic-input sourcing, capital allocation, and business-perimeter changes. An action can be directly linked to a result only when construct, object, period, geography, ownership, and reporting scope align. A product launch, for example, does not automatically receive credit from company-wide annual sales, and distribution coverage does not automatically become consumer reach.*

**Table 5.1** Strategy-Result Evidence Profile

| Group              | Documented actions | Direct | Temporal | Company-reported | Context only | Not assessable | Company claims |
|--------------------|--------------------|--------|----------|------------------|--------------|----------------|----------------|
| Wings Group        | 8                  | 0      | 0        | 0                | 0            | 8              | 0              |
| Indofood           | 0                  | 0      | 0        | 0                | 0            | 0              | 3              |
| Mayora             | 4                  | 0      | 2        | 1                | 0            | 1              | 2              |
| Unilever Indonesia | 10                 | 1      | 2        | 1                | 1            | 5              | 1              |
| Total              | 22                 | 1      | 4        | 2                | 1            | 14             | 6              |

**Note:** Counts describe assessability and evidence class, not strategy quality or effectiveness. Indofood has company claims without matching discrete actions under this extraction standard.

### 5.2 Wings Group: Documented Commercial Activity, Limited Compatible Results

Eight Wings actions are documented through official launch articles. GOLDA launched a Cappuccino variant on 8 April 2022, stated a 200 ml pack at Rp3,000, and distributed it through minimarkets, supermarkets, and the Wings Official Store. ProGuard launched on 18 August 2022 together with a campaign ambassador and the ProGuard Pro Festival. Ale-Ale FunFlava Cocopandan launched on 23 March 2023 with a stated price of Rp1,000 per cup. ISOPLUS COCO launched on 2

April 2023. All of these are company-reported actions from official Wings sources (Wings Group, 2022a; 2022b; 2023a; 2023b).

None of the eight actions has a compatible result observation at the required granularity. Public evidence does not provide a brand/category result that can be validly paired with the launch, price point, channel availability, or campaign. All Wings action-level linkages therefore remain not assessable. This is a disclosure/evidence limitation, not evidence that the strategy was ineffective.

*Track A nevertheless shows independent portfolio strengths: Wings is one brand family behind Indofood in breadth, leads two of the five selected 2026 categories, and is the observed-stability leader in four of five longitudinal blocks. These outcomes are not inherited by the Wings actions. The report does not claim that any specific launch, pricing, distribution, or marketing action caused the observed leadership or stability.*

### **5.3 Indofood: Observable Results, but Attribution Remains Company-Reported**

Within this evidence set, no discrete Indofood/ICBP action meets the same extraction standard as the action cases for Wings, Mayora, or Unilever. The project instead retains observable company results and management explanations. Indofood reports net sales of Rp115.79 trillion and operating profit of Rp23.09 trillion in FY2024; in FY2025, net sales are Rp123.49 trillion and operating profit Rp24.57 trillion. Management attributes performance to the integrated model, but no matching discrete action allows the project to identify that model as an independent cause.

ICBP reports net sales of Rp72.6 trillion and operating profit of Rp16.32 trillion in FY2024. Management links the improvement to higher volume and productivity/efficiency. These explanations remain company-reported. ICBP consolidated outcomes include overseas operations, while Indofood parent results also include businesses beyond the primary packaged-FMCG scope. The figures therefore must not be read as Indonesian household outcomes or brand-level results.

Indofood's Track A strengths are breadth leadership and momentum leadership in two blocks, while persistence records one lost observed incumbent opportunity. Track B does not support a claim that the integrated model, volume, or productivity caused those breadth, momentum, or persistence outcomes. The two tracks can only be presented side by side with an explicit attribution boundary.

### **5.4 Mayora: Temporal Alignment with Material Alternative Factors**

Mayora documents four actions for 2025: product innovation, competitive selling prices, a share buyback with a maximum approved value of Rp1 trillion, and a policy of maximizing domestic raw materials to manage input and foreign-exchange risk. These actions operate at company and consolidated-portfolio level rather than as brand-specific execution (PT Mayora Indah Tbk, 2026a).

*Mayora net sales increase from Rp36,072,949 million in FY2024 to Rp38,681,562 million in FY2025. Product innovation occurs in the same period and is therefore classified as temporally aligned, not causal. Pricing policy is also documented, but management separately states that raw-material inflation required selling-price adjustments and affected achievement of the sales target; that interpretation remains company-reported. Consolidated sales combine domestic and export/international activity.*

*Operating profit declines from Rp3,915,365 million in FY2024 to Rp3,723,712 million in FY2025. Domestic-input sourcing occurs during FY2025 and can be described as temporally aligned with that outcome, but raw-material cost pressure remains a material alternative explanation. It would therefore be invalid to claim that domestic sourcing increased or protected operating profit. The share buyback is treated as capital-allocation context because it has no compatible consumer outcome.*

### **5.5 Unilever Indonesia: One Direct Descriptive Pair and Several Bounded Linkages**

Unilever has ten documented actions. In 2024, the company expands its focus on general trade, minimarkets, and digital commerce while optimizing the distribution network; standardizes promotions; uses small-pack formats with coinage pricing in General Trade; and relaunches Wipol and Trika (PT Unilever Indonesia Tbk, 2025a). Company-level net sales decline from Rp38,611 billion in FY2023 to Rp35,139 billion in FY2024. Distribution and promotion actions are only temporally aligned with the company-sales trajectory because the outcome is too broad to isolate either action.

*Small-pack/coinage pricing has a management explanation concerning volume effects, but the project has no compatible volume observation with which to test the claim. The volume effect therefore remains company-reported. The Wipol and Trika relaunches also lack compatible brand-level results and do not inherit company-wide outcomes.*

The strongest case concerns Sunlight in Q1 2025. The strategy example documents a product/packaging proposition, social-first and out-of-home promotion, broad outlet coverage, and competitive pricing through Net Revenue Management. Of these four actions, only distribution has a result with the same construct: the company reports coverage above 70% of direct stores during the launch. This pair is directly supported at a descriptive level because brand, geography, period, and construct align (PT Unilever Indonesia Tbk, 2025b).

### SUNLIGHT INTERPRETATION BOUNDARY

Coverage above 70% of direct stores is a distribution-availability measure during the launch. It is not consumer reach, purchase, sales impact, market share, profitability, or evidence of superior overall strategy effectiveness.

The Ice Cream separation on 8 December 2025 explains a change in the continuing-operation reporting perimeter and represented comparator; it is context only for performance interpretation. SariWangi was also transferred on 2 March 2026 and is not carried into later portfolio outcomes. These ownership changes are important so that longitudinal comparisons do not attribute disposed businesses to periods after disposal.

## 5.6 Evidence Profile Is Not a Strategy-Effectiveness Ranking

**Figure 5.1 Track B Strategy-Result Evidence Profile**

*Source: project evidence screening. Counts represent evidence class/assessability and must not be read as performance or a strategy-effect ranking.*

Figure 5.1 shows asymmetry in disclosure and result compatibility. Wings has eight actions but all are not assessable; Unilever has the most varied evidence classes; Mayora has temporal alignment and company attribution; and Indofood appears through company claims without a matching discrete action. Calling Unilever the “best strategy” merely because it has one direct pair would conflate evidence availability with effect size - two different concepts.

## 5.7 Track B Summary

### **TRACK B - KEY FINDINGS**

There is no comparable cross-group strategy-effect leader. The only direct descriptive pair is Sunlight distribution availability in Q1 2025. Other evidence is temporal, company-reported, context-only, or not assessable. Financial results and portfolio outcomes cannot be attributed to specific actions without compatible linkage evidence.

## CHAPTER VI. CROSS-TRACK SYNTHESIS: WHO WINS, AND ON WHICH DIMENSION?

Chapters IV and V show that “winning” has more than one form. This chapter brings the two tracks together without converting different metrics into one score. Its purpose is to answer the report title by identifying which group leads each dimension, why those results differ, and why Track B does not transform Track A leaders into a causal strategy ranking.

### 6.1 Cross-Track Synthesis by Group

**Table 6.1** *Track A and Track B Synthesis by Group*

| Group              | Track A strengths                                                          | Strategy-result evidence                                                           | Bounded conclusion                                                                                                                                     |
|--------------------|----------------------------------------------------------------------------|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Wings Group        | Breadth 37; 2/5 selected leaders; stability 4/5; 1 challenger takeover.    | 8 actions; all not assessable at the action-result level.                          | Documented commercial activity and portfolio strengths can be stated separately; the evidence does not identify which action produced those strengths. |
| Indofood           | Breadth leader 38; momentum leader 2/5; 1 incumbent opportunity lost.      | Company results + 3 management-attribution claims; no matching discrete action.    | Breadth leadership and reported results are valid; integrated model, volume, and productivity remain company-reported attributions.                    |
| Mayora             | Breadth 22; Le Minerale sensitivity raises it to 23 without changing rank. | 4 actions: 2 temporal, 1 company-reported, 1 not assessable.                       | Selected actions can be discussed alongside results with geography/input-cost caveats; effects on Indonesian household demand are not isolated.        |
| Unilever Indonesia | 3/5 selected leaders; 3/3 incumbent retention; momentum 2/5.               | 10 actions: 1 direct, 2 temporal, 1 company-reported, 1 context, 5 not assessable. | The Sunlight direct pair is strongest descriptively but does not explain all Track A strengths or prove superior strategy effectiveness.               |

## **6.2 Breadth Is Not the Same as Category Leadership**

Indofood has the largest breadth but does not lead any of the five selected 2026 category events. Unilever has a smaller breadth of 25 brand families but leads three of the five selected events. Wings is very close to Indofood in breadth and leads two selected categories. The results show that the number of brand families and the ability to take the top observed position in selected categories measure different aspects of portfolio power.

This difference also explains why breadth cannot be assigned an arbitrarily larger weight simply because it is easy to count. If the analytical objective is structural brand-family diversification, Indofood leads. If the objective is selected focal-category leadership in 2026, Unilever leads. Declaring one objective “more important” would require an external weighting rule that the evidence does not provide.

## **6.3 Stability Is Not the Same as Momentum**

Wings leads stability in four blocks but leads momentum in only one. Indofood and Unilever each lead momentum in two blocks. The pattern demonstrates that historical stability and net change toward the end of a period are not the same. A portfolio can maintain a consistent pattern without improving the most, while a portfolio with stronger momentum can experience greater period-to-period variation.

## **6.4 Persistence Reflects Role-Specific Competitive Positions**

Unilever shows strong incumbent retention across three observed opportunities, while Wings demonstrates one challenger takeover. These cannot be reduced to a single persistence score because roles and denominators differ. For business readers, the distinction matters: defending an incumbent position and taking leadership from an incumbent are different forms of competitive strength.

## **6.5 Strategy Evidence Does Not Causally Explain Portfolio Outcomes**

*Track B does not identify a common causal scale. Wings has portfolio strengths but insufficient compatible outcome disclosure to test its actions. Indofood has financial results and management explanations but no matching discrete action. Mayora has temporal alignments bounded by mixed geography and input costs. Unilever has one direct descriptive distribution pair, but that result is not sales, market share, or consumer reach. Track B therefore cannot be used to causally “explain” who wins in Track A.*

This does not mean strategy has no role in the real world. The conclusion is narrower: the available evidence set does not independently identify that effect. The public report preserves the

distinction among documented action, plausible mechanism, temporal alignment, company attribution, and independently supported result.

## 6.6 Who Wins on Each Dimension?

### Final Dimension-Specific Conclusions

| Dimension                          | Validated conclusion             |
|------------------------------------|----------------------------------|
| Brand-family breadth               | Indofood                         |
| Selected focal-category leadership | Unilever Indonesia               |
| Observed longitudinal stability    | Wings Group                      |
| Momentum                           | Indofood + Unilever Indonesia    |
| Competitive persistence            | Role-specific; not rankable      |
| Strategy-result evidence           | No comparable cross-group leader |
| Overall portfolio winner           | Not defensible                   |

**Figure 6.1 Final Dimension-Specific Conclusions**

*Source: final analytical synthesis. The figure is dimension-specific and is not an overall ranking.*

**Table 6.2 Concise Answers by Dimension**

| Question                               | Validated answer                                                                       |
|----------------------------------------|----------------------------------------------------------------------------------------|
| Who has the broadest portfolio?        | Indofood - 38 strict-control brand families.                                           |
| Who leads selected 2026 categories?    | Unilever Indonesia - 3 of 5; Wings 2 of 5.                                             |
| Who is most stable in eligible blocks? | Wings Group - 4 of 5.                                                                  |
| Who leads the most momentum blocks?    | Indofood and Unilever Indonesia - 2 of 5 each.                                         |
| Who is most persistent?                | No portfolio-wide rank; Unilever 3/3 incumbent retention, Wings 1 challenger takeover. |
| Who has the most effective strategy?   | Cannot be ranked from the current evidence.                                            |
| Who is the overall winner?             | Not defensible.                                                                        |

## 6.7 Why a Single Overall Winner Is Not Defensible

A single overall winner would require four additional decisions: how to normalize breadth, selected leadership, stability, momentum, persistence, and evidence strength; how to treat missing or

non-comparable dimensions; the relative weight of each dimension; and the substitution rule when one group leads one dimension but is weaker or unmeasured on another. None of those decisions has a sufficiently empirical basis in this project.

Creating a score after observing the results would also risk producing a winner that depends on the chosen weights. A breadth-dominant weighting would favor Indofood; greater weight on selected leadership and retention would favor Unilever; and heavier stability weighting would favor Wings. Because the weights are not pre-specified and the metrics do not share a common scale, a composite ranking would reflect score design more than evidence.

#### **MAIN CONCLUSION**

“Winning” depends on the dimension measured. A single overall winner is not defensible, but dimension-level leaders are substantive: Indofood for breadth; Unilever for selected focal-category leadership; Wings for observed stability; Indofood and Unilever for momentum; persistence remains role-specific; and no strategy-effect ranking is available.

### **6.8 Analytical Implications**

For business readers, the first implication is that “brand strength” needs a more specific definition. Breadth answers coverage of brand families; a TBI snapshot answers relative survey-index position within a category; stability and momentum describe longitudinal behavior; and persistence describes a role-specific competitive path. Combining all of them without defining an objective would remove information rather than add it.

The second implication is the importance of evidence boundaries when discussing strategy. Pricing, marketing, supply, investment, and distribution can be discussed as actions and mechanisms, but result attribution must match granularity. Company-level margin movement does not prove a procurement strategy; sales growth is not the same as volume; and launch coverage is not the same as consumer reach. This semantic discipline narrows interpretation but makes it more defensible.

## CHAPTER VII. CONCLUSION

Chapter VII summarizes the final answers without adding new evidence. The conclusion preserves distinctions among performance dimensions, ownership perimeter, comparability, and strategy-result evidence.

### 7.1 Answers to the Analytical Questions

- 1. Breadth.** Indofood has the largest verified strict-control brand-family breadth at 38, narrowly ahead of Wings at 37.
- 2. Distributed strength or superstar concentration.** Public evidence is insufficient to calculate performance-weighted concentration defensibly; selected category leadership shows that strength is not identical to breadth.
- 3. Category leadership.** Unilever leads 3 of 5 selected complete 2026 focal categories, while Wings leads 2 of 5.
- 4. Consistency.** Wings leads observed stability in 4 of 5 directly comparable longitudinal blocks.
- 5. Competitive persistence.** Unilever retains 3/3 incumbent opportunities; Wings records 1 challenger takeover; unequal opportunities prevent a portfolio-wide rank.
- 6. Strategy and company results.** Only one direct descriptive pair is available; the remaining evidence is heterogeneous, company-reported, temporal, context-only, or not assessable.
- 7. Overall winner.** Not defensible because leaders differ by dimension, a common scale is unavailable, and weighting cannot be set without post hoc assumptions.

### 7.2 Overall Assessment of the Four Groups

Indofood shows structural strength in breadth and momentum leadership in two eligible blocks. Wings has nearly the same breadth, leads stability, and records one challenger takeover. Unilever Indonesia has smaller breadth but stronger selected category leadership, strong incumbent retention, and shared momentum leadership. Mayora does not lead a rankable primary dimension, but the Le Minerale sensitivity does not change the conclusion; this must not be generalized into company weakness because the evidence scope is limited to the dimensions and sources analyzed.

*Track B adds important context but does not convert that hierarchy into a strategy ranking. Wings shows documented commercial activity without compatible outcome data. Indofood has reported results and management explanations that remain company-reported. Mayora has temporal alignment and company attribution with mixed-geography and input-cost caveats. Unilever has a direct descriptive Sunlight distribution pair, but there is no basis to call it the company with the best overall strategy effectiveness.*

### 7.3 Final Conclusion

#### **FINAL VERDICT**

No single overall FMCG group winner is methodologically defensible from the available evidence. Clear leaders do exist on specific dimensions. The question “who wins?” therefore must always be followed by “on which dimension?”

This conclusion is not a compromise that avoids a decision. It separates forms of advantage that are often conflated in brand comparisons. Indofood wins breadth; Unilever wins selected focal-category leadership; Wings wins observed stability; Indofood and Unilever share momentum leadership; persistence reflects different competitive roles; and strategy-effect evidence does not yet support a cross-company ranking. Each conclusion has a traceable denominator, period, and caveat.

Portfolio power in Indonesia's consumer market is therefore multidimensional. The broadest company is not automatically the most dominant in selected category snapshots; the most stable company is not automatically the one with the strongest momentum; and the company with the most complete strategy-result evidence is not automatically the one with the most effective strategy. Keeping these distinctions visible produces a more informative assessment than forcing a single winner through a combined score that is not defensible.

## APPENDIX A. SUMMARY OF OWNERSHIP AND PORTFOLIO PERIMETERS

This appendix summarizes the main attribution rules used to determine whether a brand enters the primary strict-control portfolio. The complete registry remains available in the repository so the report does not duplicate every brand row.

**Table A.1** *Treatment of Relationship Classes in Ownership Mapping*

| Relationship class                         | Primary treatment                                                      | Example/boundary                                                                             |
|--------------------------------------------|------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| controlled /<br>controlled_group_portfolio | Included in strict-control primary if current in the reference period. | Wings group-level portfolio may receive credit even when the operating entity is unresolved. |
| joint_venture                              | Excluded from full strict-control primary.                             | PT Lion Wings, PT Glico Wings, PT Calbee Wings.                                              |
| related_group_affiliate                    | Excluded from primary; may enter sensitivity/context.                  | PT Tirta Fresindo Jaya / Le Minerale.                                                        |
| former_portfolio                           | Eligible only before ownership ends.                                   | Unilever Ice Cream after 8 Dec 2025 is not carried into later outcomes.                      |
| controlled_context_only /<br>unclear       | Excluded from primary aggregation.                                     | Retained for provenance or unresolved mapping.                                               |

## APPENDIX B. CORE COMPARABILITY RULES

**Table B.1** *Summary of Comparability Rules*

| Rule                                     | Application                                                                                                                 |
|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| Top Brand same category/year             | May be compared with caveat when source subcategory, metric, unit, period, and survey surface match.                        |
| Top Brand longitudinal                   | Only within the same brand and source subcategory; unresolved methodology/identity/ownership breaks stop momentum analysis. |
| Top Brand across categories              | Not comparable; TBI is not averaged or ranked across categories.                                                            |
| Missing Top Brand cell                   | Retain unavailable; no zero, interpolation, or carry-forward.                                                               |
| Brand Footprint rank                     | Context/comparable-with-caveat only within a documented universe; rank is not interval scale.                               |
| Urban vs national Brand Footprint        | Not comparable across the coverage break.                                                                                   |
| Cross-source TBI vs CRP/penetration/rank | Not comparable on one scale; only dimension-level synthesis after separate interpretation.                                  |
| Ownership invalid period                 | Observation is not attributed to the former owner.                                                                          |

## APPENDIX C. KEY SOURCES AND PROVENANCE

**Table C.1** *Source Groups and Analytical Functions*

| Source family               | Publisher                         | Use in the project                                               | Primary restriction                                                                                 |
|-----------------------------|-----------------------------------|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| Corporate portfolio/filings | Wings, Indofood, Mayora, Unilever | Ownership, brand portfolio, strategy actions, reporting results. | Company-reported claims remain labelled; copyrighted raw documents are not republished.             |
| Top Brand                   | Frontier / Top Brand Award        | TBI, category position, selected longitudinal observations.      | Detailed reports are restricted; public pages support limited factual use; TBI is not market share. |
| Brand Footprint             | Worldpanel by Numerator           | Methodology, selected rank/reach/growth context.                 | Public summary is selective; no bulk copying; urban-national break is preserved.                    |

## APPENDIX D. SUMMARY OF STRATEGY-RESULT CASES

**Table D.1** *Interpretation Boundaries for Strategy-Result Cases*

| Group/case                                     | Evidence class     | What may be concluded                                                        | What is prohibited                                                                |
|------------------------------------------------|--------------------|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| Wings product launches                         | Not assessable     | Launch activity is documented.                                               | Do not attribute leadership, stability, sales, or profit.                         |
| Wings pricing, distribution, and marketing     | Not assessable     | Commercial execution is documented.                                          | Do not claim pricing, marketing, or distribution effectiveness or consumer reach. |
| Indofood integrated model                      | Company-reported   | Management attributes performance to the integrated model.                   | Do not call the integrated model an independently identified cause.               |
| ICBP volume/productivity                       | Company-reported   | Management explanation may be reported as company-reported.                  | Do not treat volume/productivity as an independent cause.                         |
| Mayora innovation + sales                      | Temporal alignment | Action and sales occur in the same period.                                   | Do not say innovation caused sales.                                               |
| Mayora sourcing + operating profit             | Temporal alignment | Sourcing and operating-profit period may be discussed together with caveats. | Do not say sourcing increased or protected profit.                                |
| Unilever distribution/promotion + FY2024 sales | Temporal alignment | Actions and company-sales trajectory are temporally aligned.                 | Do not say the actions caused FY2024 sales.                                       |
| Sunlight Q1 2025 distribution                  | Direct descriptive | Launch included broad outlet coverage; reported at >70% of direct stores.    | Do not infer sales, market share, consumer reach, profitability, or causality.    |
| Ice Cream separation                           | Context only       | Explains reporting perimeter/comparator.                                     | Do not call the separation a performance driver.                                  |

## APPENDIX E. TRACEABILITY OF FINAL FINDINGS

**Table E.1** *Traceability of Ten Final Findings*

| ID    | Concise finding                                                         | Evidence role               |
|-------|-------------------------------------------------------------------------|-----------------------------|
| FND01 | Indofood leads verified strict-control brand-family breadth.            | Track A breadth             |
| FND02 | Unilever leads selected complete focal-category leadership.             | Track A category leadership |
| FND03 | Stability and momentum identify different portfolio strengths.          | Track A longitudinal        |
| FND04 | Persistence separates incumbent retention from challenger takeover.     | Track A persistence         |
| FND05 | Mayora ownership sensitivity does not change the primary conclusion.    | Track A sensitivity         |
| FND06 | Wings strategy evidence is constrained by compatible result disclosure. | Track B Wings boundary      |
| FND07 | Indofood/ICBP explanations remain company-reported.                     | Track B Indofood boundary   |
| FND08 | Mayora supports bounded temporal/company-reported interpretation.       | Track B Mayora boundary     |
| FND09 | Unilever provides the only direct descriptive strategy-result pair.     | Track B Unilever boundary   |
| FND10 | One overall winner remains not defensible.                              | Cross-track synthesis       |

## APPENDIX F. FINAL VALIDATION SUMMARY

**Table F.1** *Analytical Validation Summary*

| Validation area            | Result                                                                     |
|----------------------------|----------------------------------------------------------------------------|
| Input integrity            | 13/13 governed inputs match locked checksums.                              |
| Breadth reconciliation     | 38 / 37 / 25 / 22 reconciled.                                              |
| Leadership reconciliation  | Unilever 3; Wings 2 across five selected 2026 categories.                  |
| Stability reconciliation   | Wings 4 of 5; Indofood 1 of 5.                                             |
| Momentum reconciliation    | Indofood 2; Unilever 2; Wings 1.                                           |
| Persistence reconciliation | 4 eligible incumbent opportunities retained; role-specific interpretation. |
| Track B reconciliation     | 22 actions; 6 company claims.                                              |
| Semantic boundaries        | No TBI/rank/distribution relabelled as market share or consumer reach.     |
| Causal boundary            | No final finding claims causal identification.                             |
| Composite boundary         | No normalization, weighting, or composite score.                           |
| Final gate                 | PASS_WITH_CAVEAT; zero critical failures across 40 checks.                 |
